This paper discusses and answers how political representation and labor unions impact economic inequality. They used data from OCED which is free and accessible. They use generalized linear regressions. This paper is great because it ties in both ideas of wages and how unions influence that. This paper will be great for providing the context and background for my paper.

This paper answers how US state corporate income taxes impact/affect union wage premiums. The dataset that they use is the publicly accessible survey, Current Population Survey (CPS). Regarding techniques they use, they start by creating a model of the firm that incorporates union wage determination. Since the data is so large, they create subsets, 46 total dummy variables, and run multiple regressions.
